

Notion Mirror Demo Page

A sample page demonstrating how Notion Mirror exports common Notion blocks to Git-backed Markdown.

Overview

Notion Mirror converts Notion content into a version-controlled Markdown repository.

Because every sync becomes a Git commit, changes are easy to diff, search, back up, and recover.

Tip: This page intentionally contains many different Notion block types so you can verify export fidelity.

Text Formatting

This paragraph contains **bold**, *italic*, ~~strikethrough~~, `inline code`, and a <https://developers.notion.com>.

You can also mix **bold and** `inline code` **together** inside the same sentence.

Headings

Heading Level 2

Heading Level 3

Heading Level 4

Useful for validating Markdown heading rendering.

Bulleted Lists

- Machine Learning
 - Quantization
 - INT8
 - FP16
 - Distillation
 - Distributed Systems
 - Consensus
 - Fault Tolerance
 - Platform Engineering
-

Numbered Lists

1. Collect data
 2. Train model
 3. Evaluate metrics
 4. Deploy service
 - a. Staging
 - b. Production
-

To-Do List

- ☒ ~~Create Notion integration~~
- ☒ ~~Enable Read Content capability~~
- ☒ ~~Share root page~~
- ☒ ~~Sync workspace~~

- ☐ Export database rows
 - ☐ Add automated tests
-

Quote Block

Simplicity is prerequisite for reliability.
— Edsger W. Dijkstra

Callout

 **Notion Tip:** Use one shared root page for all notes if you want to minimize manual sharing with the integration.

Toggle Example

Experimental Results

▼ Toggle block:

- Accuracy improved after INT8 calibration.
 - Inference latency reduced significantly.
 - Memory usage decreased.
-

Code Blocks

```
print("Demo page")
```

Child Pages

Create the following child pages:

Machine Learning Notes

Distributed Systems Notes

Interview Preparation

These help validate page hierarchy export.
